Pitfalls

How we Develop Software

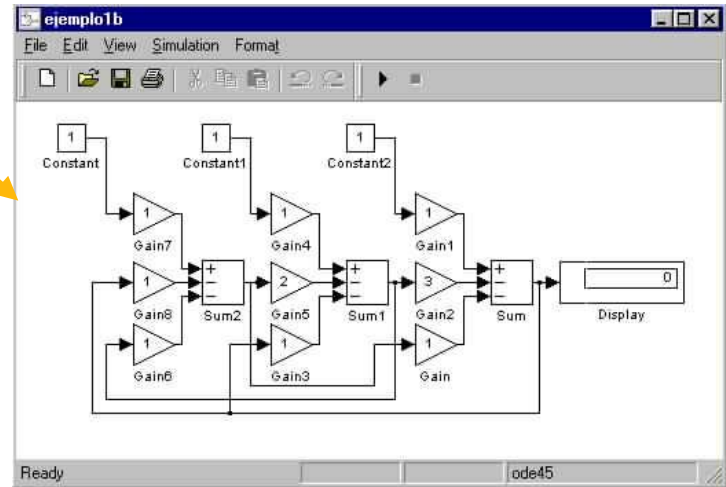

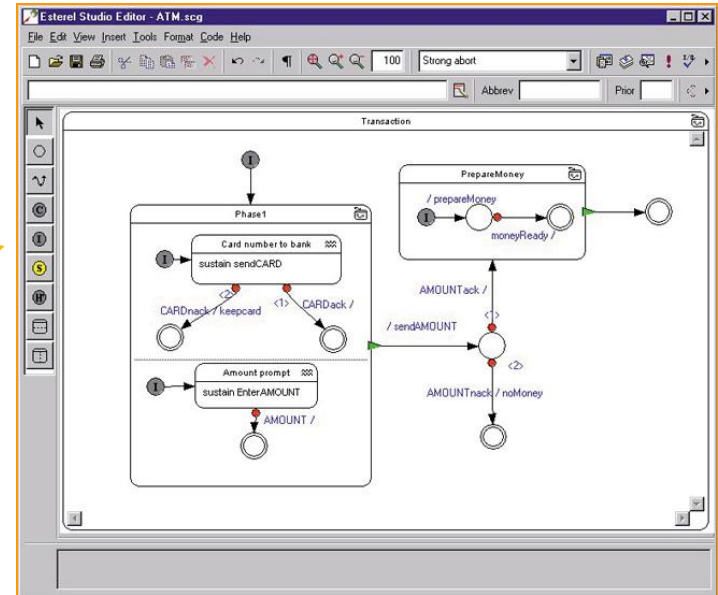

What is Model-Based Development?

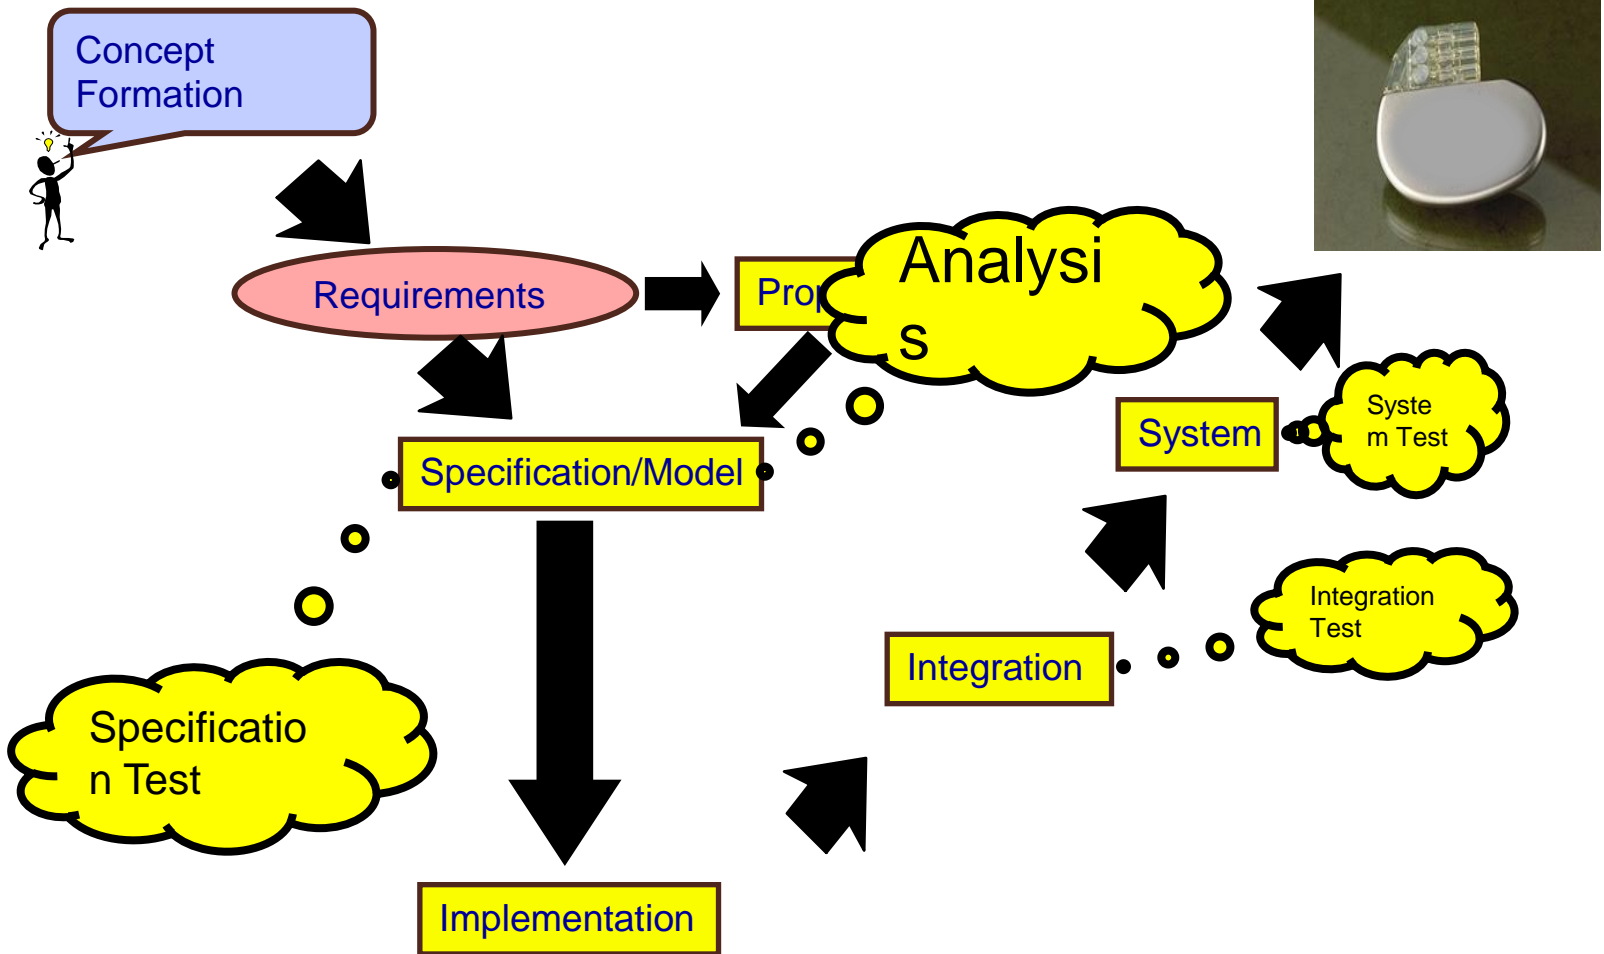

Model-Based Development Tools

- Esterel Studio and SCADE Studio from Esterel Technologies
- Rhapsody from I-Logix
- Simulink and Stateflow from Mathworks Inc.
- Rose Real-Time from Rational
- I will focus on Statecharts and Dataflow notations.

How we **Will** Develop Software (in theory)

Model-Based Development Examples

| Company | Product | Tools | Specified & Autocoded | Benefits Claimed |
|--|--|---------------------------------|---|---|
| Airbus | A340 | SCADE With Code Generator | <ul style="list-style-type: none"> • 70% Fly-by-wire Controls • 70% Automatic Flight Controls • 50% Display Computer • 40% Warning & Maint Computer | <ul style="list-style-type: none"> • 20X Reduction in Errors • Reduced Time to Market |
| Eurocopter | EC-155/135 Autopilot | SCADE With Code Generator | <ul style="list-style-type: none"> • 90 % of Autopilot | <ul style="list-style-type: none"> • 50% Reduction in Cycle Time |
| GE & Lockheed Martin | FADEDC Engine Controls | ADI Beacon | <ul style="list-style-type: none"> • Not Stated | <ul style="list-style-type: none"> • Reduction in Errors • 50% Reduction in Cycle Time • Decreased Cost |
| Schneider Electric | Nuclear Power Plant Safety Control | SCADE With Code Generator | <ul style="list-style-type: none"> • 200,000 SLOC Auto Generated from 1,200 Design Views | <ul style="list-style-type: none"> • 8X Reduction in Errors while Complexity Increased 4x |
| US Spaceware | DCX Rocket | MATRIXx | <ul style="list-style-type: none"> • Not Stated | <ul style="list-style-type: none"> • 50-75% Reduction in Cost • Reduced Schedule & Risk |
| PSA | Electrical Management System | SCADE With Code Generator | <ul style="list-style-type: none"> • 50% SLOC Auto Generated | <ul style="list-style-type: none"> • 60% Reduction in Cycle Time • 5X Reduction in Errors |
| CSEE Transport | Subway Signaling System | SCADE With Code Generator | <ul style="list-style-type: none"> • 80,000 C SLOC Auto Generated | <ul style="list-style-type: none"> • Improved Productivity from 20 to 300 SLOC/day |
| Honeywell Commercial Aviation Systems | Primus Epic Flight Control System | MATLAB Simulink | <ul style="list-style-type: none"> • 60% Automatic Flight Controls | <ul style="list-style-type: none"> • 5X Increase in Productivity • No Coding Errors • Received FAA Certification |

Does Model-Based Development Scale?

Airbus A380

| | |
|------------------------|---------------|
| Length | 239 ft 6 in |
| Wingspan | 261 ft 10 in |
| Maximum Takeoff Weight | 1,235,000 lbs |
| Passengers | Up to 840 |
| Range | 9,383 miles |

Systems Developed Using MBD

- Flight Control
- Auto Pilot
- Fight Warning
- Cockpit Display
- Fuel Management
- Landing Gear
- Braking
- Steering
- Anti-Icing
- Electrical Load Management

...But it is not all roses

- Many MBD projects fail to meet their original goals of cost, productivity
 - These tend not to get as much publicity!
- Clear eyed understanding of *why* you model and *what you expect* is necessary

A Personal Anecdote

- Part of two large projects using Model-Based Development
 - Same company, similar quality developers
 - One great success
 - Significant cost reductions
 - Improvement in quality
 - Excellent customer satisfaction
 - One great failure
 - Large cost overruns
 - Models considered less useful than code
 - Group abandoned MBD

Outline of Presentation

Introduction

Why use Model-Based Development?

Requirements

Design

Implementation: Code Generation

Verification and Validation

Pitfalls

What are your models *for*?

- Possible to use MBD for many different purposes:
- Requirements
- Design
- Simulation
- Visualization
- Testing
 - Test Generation
 - Test Oracle
- Formal Verification
- Code Generation
 - Complete implementation
 - Code skeleton
- Prototyping
- Communication with Customer

You must understand, **up front**, what you expect to do with models in order to successfully adopt

MBD

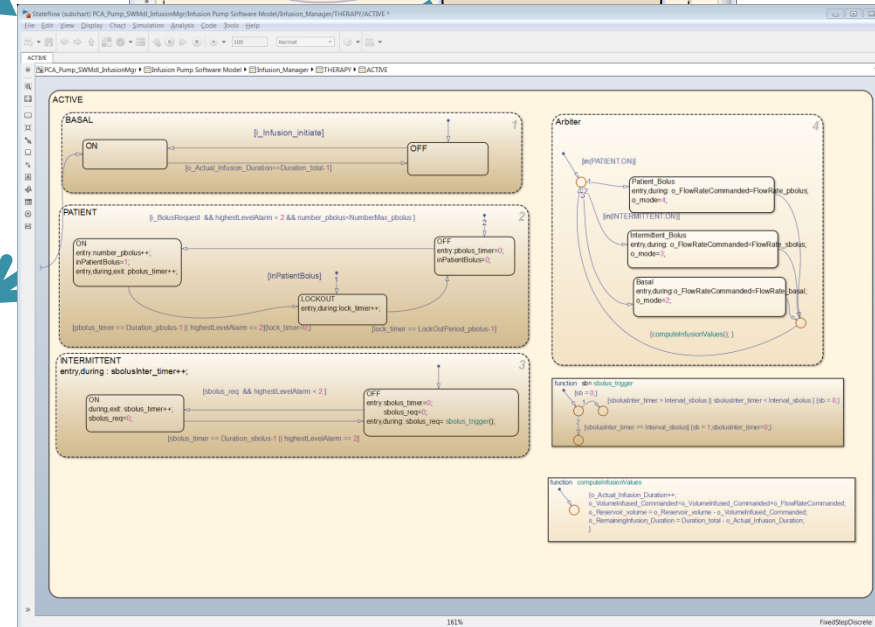

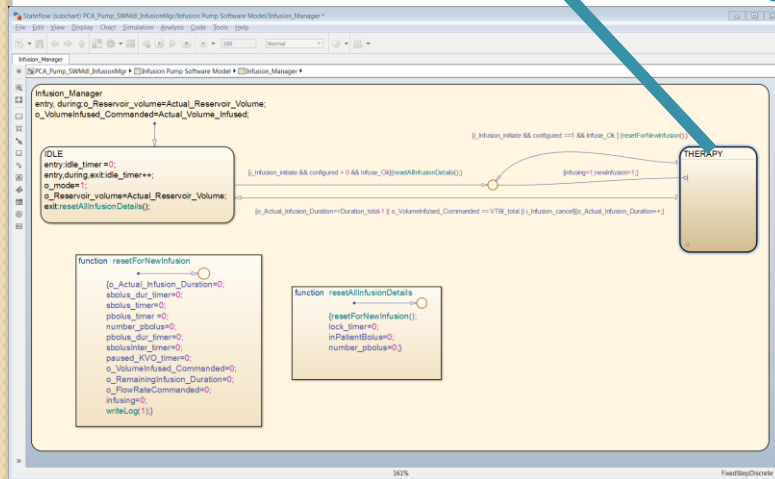

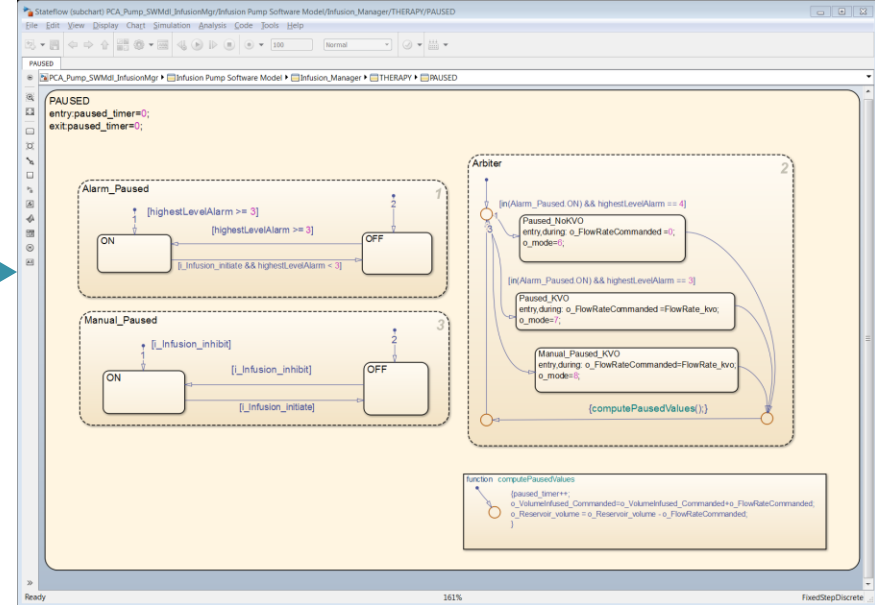

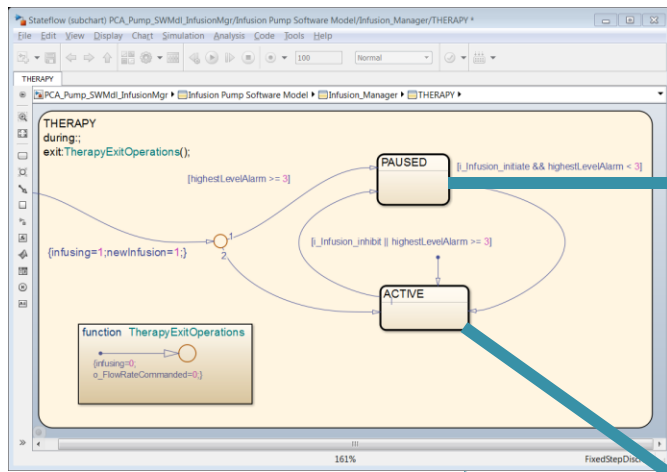

Major opportunity for improvement in V&V

MBD Models as Requirements

- Are MBD models requirements?

A large, stylized, red-to-orange gradient word "NO" on a black background. The letters are bold and have a slight shadow effect.

- Notations in this talk are executable; good at describing *how* system works

- Lots of design detail
- Difficult to see “full system” behavior.
- Straightforward to generate code

Outline of Presentation

Introduction

Why use Model-Based Development?

Requirements

Design

Implementation: Code Generation

Verification and Validation

Pitfalls

The Most Important Issue for Successful Adoption of MBD

Do the Domain-Specific Notations provide a natural representation for your problem?

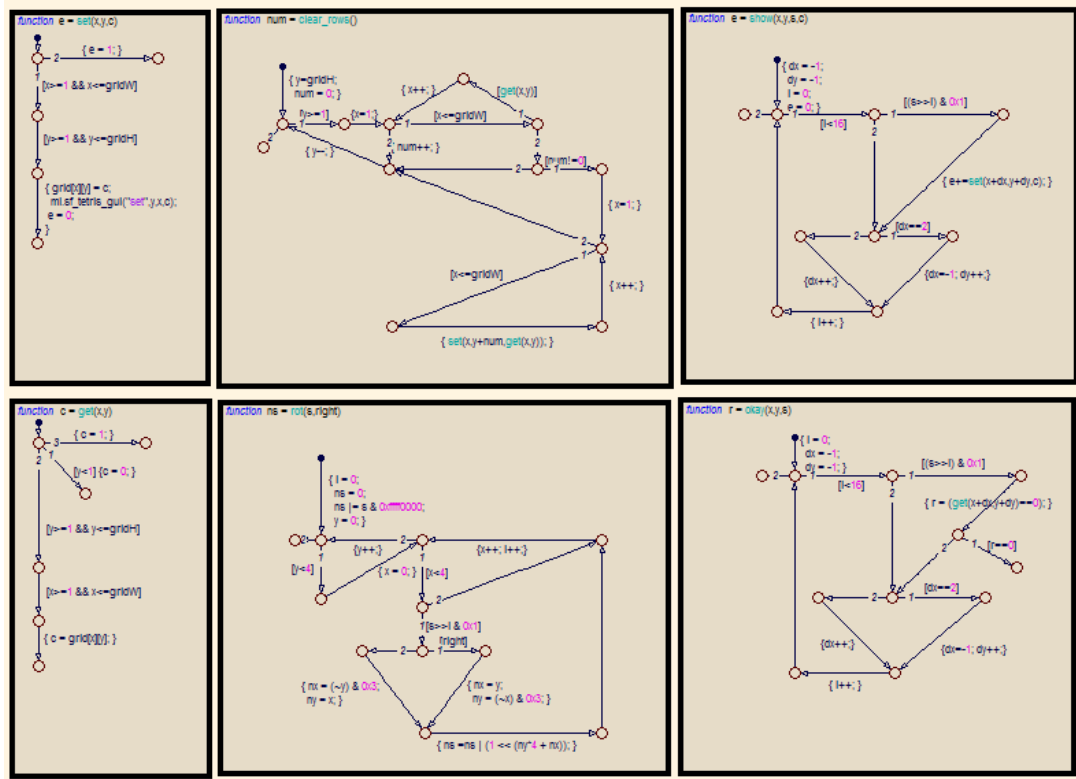

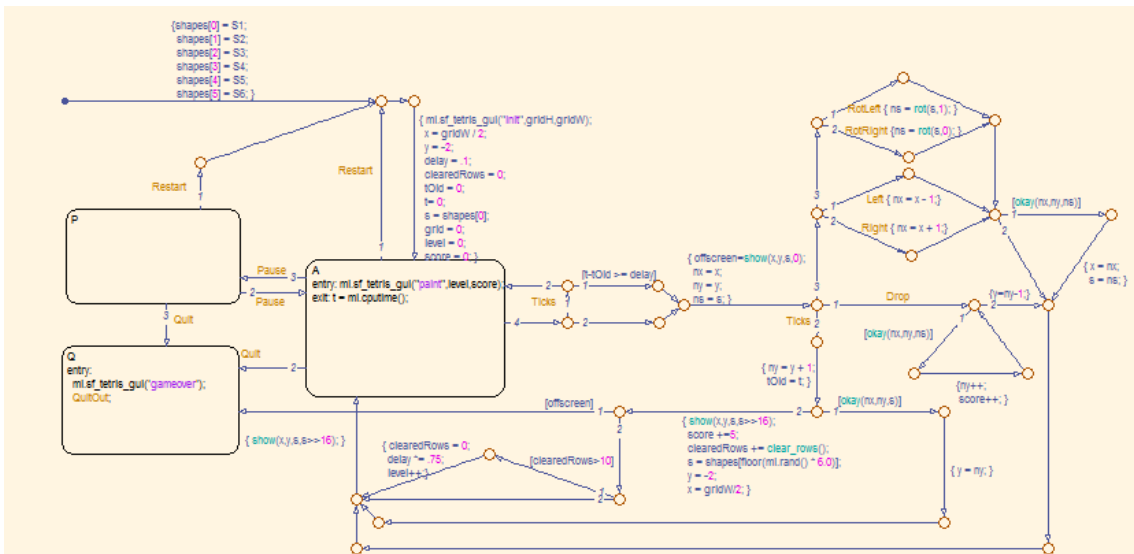

- Block diagrams are *very natural* for control problems
- Statecharts are *very natural* for description of system modes & mode transitions
- Both block diagrams and statecharts are *very unnatural* for representing complex data structures
- Neither notation naturally supports iteration or recursion
 - It can be “faked”, but not well

Just...No

Stateflow model of Tetris game (included in the Stateflow Demo models from the Mathworks!).

Diagram is essentially a control-flow graph of a program that implements tetris.

Much harder to read and modify than an equivalent program.

Tools Matter

- Often notations are much more cumbersome to use than text
 - No diff / merge capabilities
 - Adding information requires many clicks
- Expressible != Easy
- Anecdote: Simulink vs. SCADE at Rockwell Collins in 2006
 - SCADE had formal pedigree, strong analysis
 - But tools kept crashing on our Windows boxes
 - Simulink had better tools and better salespeople

Outline of Presentation

Introduction

Why use Model-Based Development?

Requirements

Design

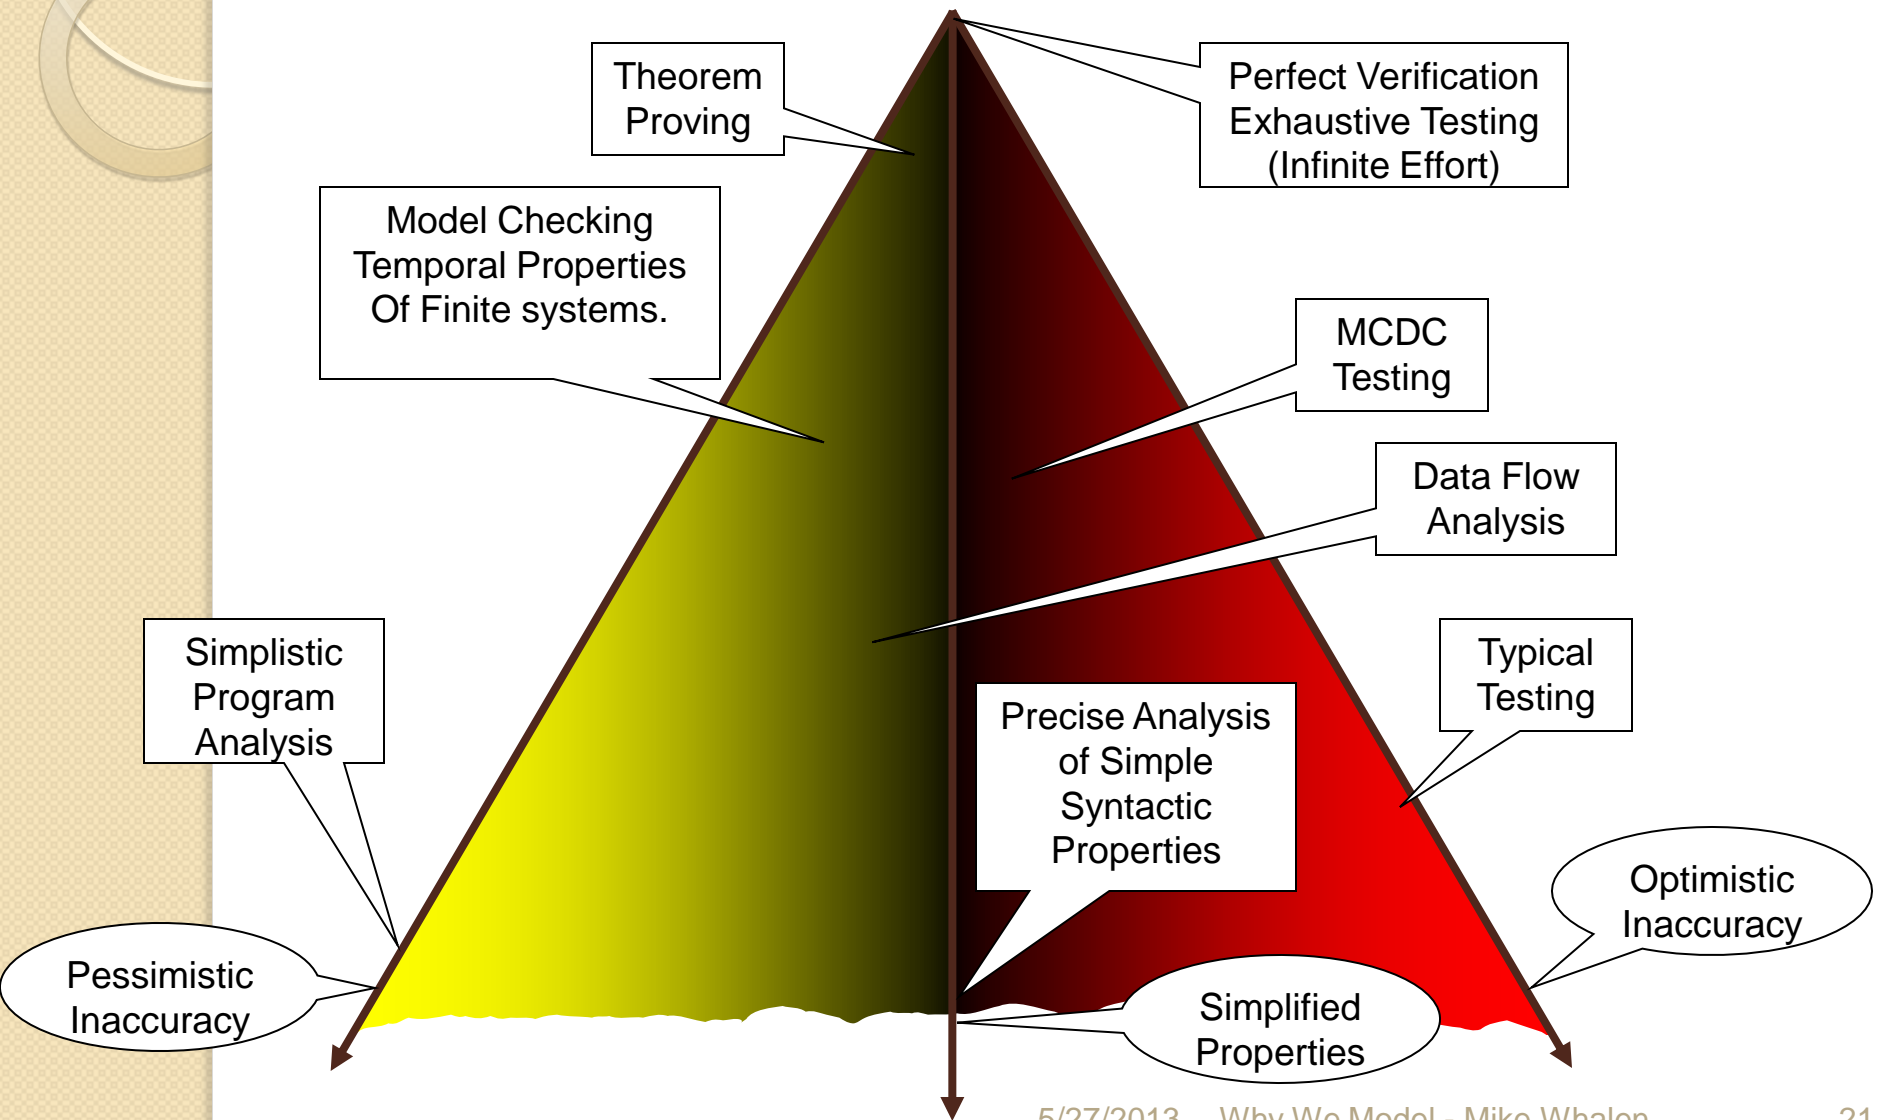

Implementation: Code Generation

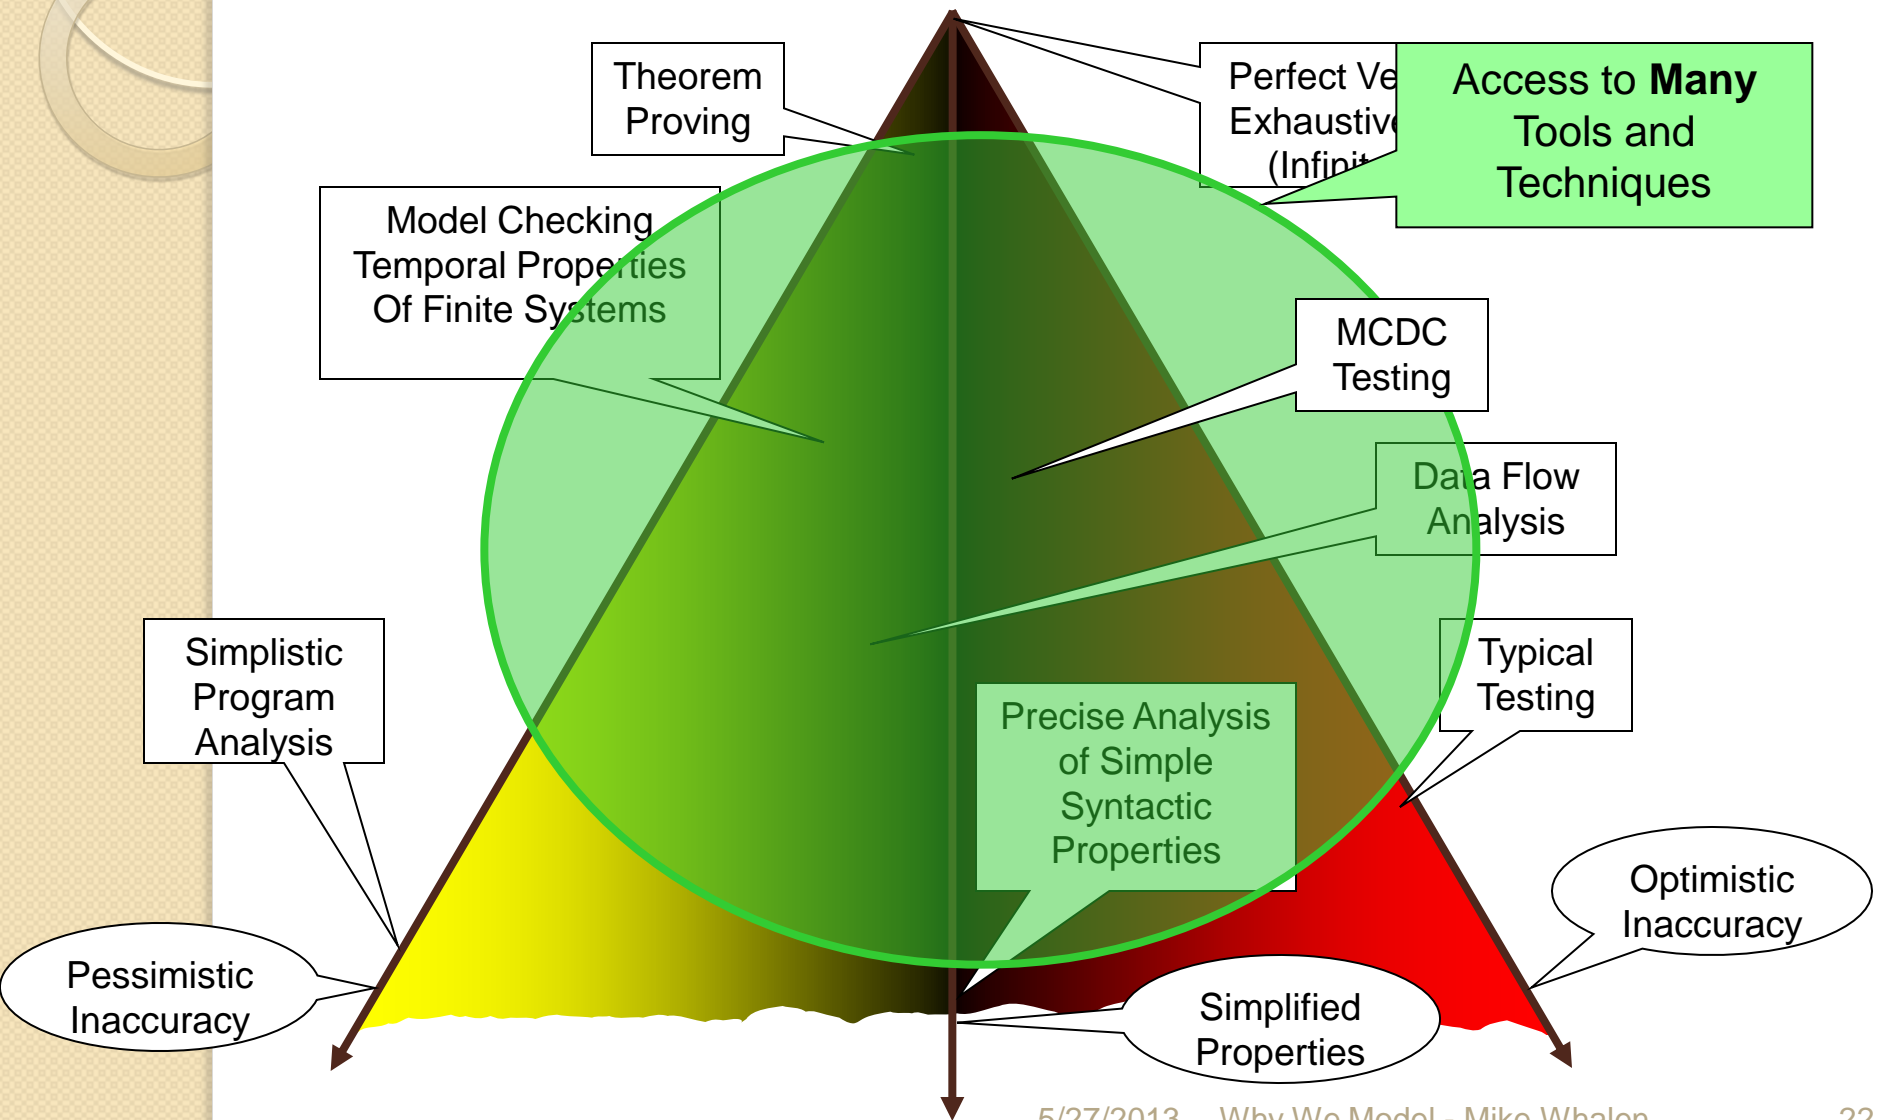

Verification and Validation

Pitfalls

Analysis Pyramid

What We Need

MBD Is a V&V-Enabling Technology

- Strong simulation and analysis capabilities built into most tools
 - Demo: Stateflow Elevator
 - (Help: Stateflow/Demos/Large-Scale Modeling/Modeling an Elevator System)
- Even stronger simulation capabilities in external tools
 - Demo: Reactis step simulation with Microwave
- Allows straightforward “Build a little, test a little” philosophy
 - Consistent with incremental development philosophy

Model-Driven Test Generation

(v1)

Source Code

```
while(a<0) {  
  a=a-1;  
  b=b*a;  
}  
printf("%d",  
  b);
```

Compiler

Object Code

MBD Model

Test Case
Generator

Generated
Tests

Coverage
Metric

Possible to generate test suites that satisfy very rigorous structural coverage metrics

Model results must match source code for tests to pass

Model-Driven Test Generation (v2)

MBD Model

Code Generator + Compiler

Object Code

Test Case Generator

Generated Tests

Coverage Metric

Model should match source code exactly

Model-Driven Test Generation (v2)

MBD Model

Code Generator + Compiler

Object Code

Test Case Generator

Generated Tests

Oracle

Coverage Metric

Model should match source code exactly

Where does Oracle come from?
What is a good oracle?

Use Requirements as Oracle

ADGS 2100 Adaptive Display and Guidance System

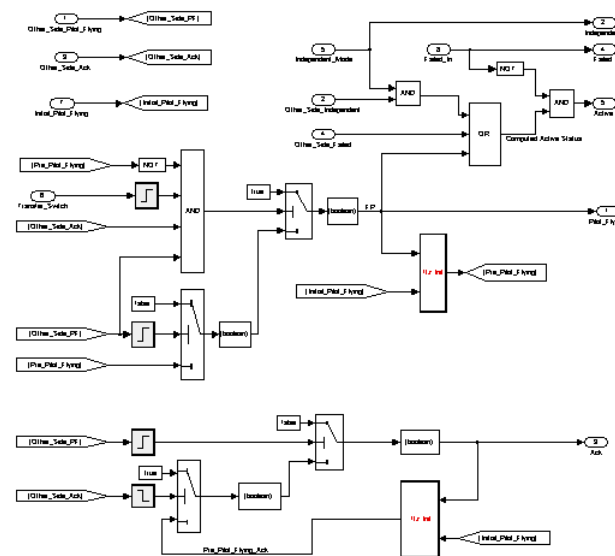

Modeled in Simulink
Translated to NuSMV
4,295 Subsystems
16,117 Simulink Blocks
Over 10^{37} Reachable States

Example Requirement:

**Drive the Maximum Number of Display Units
Given the Available Graphics Processors**

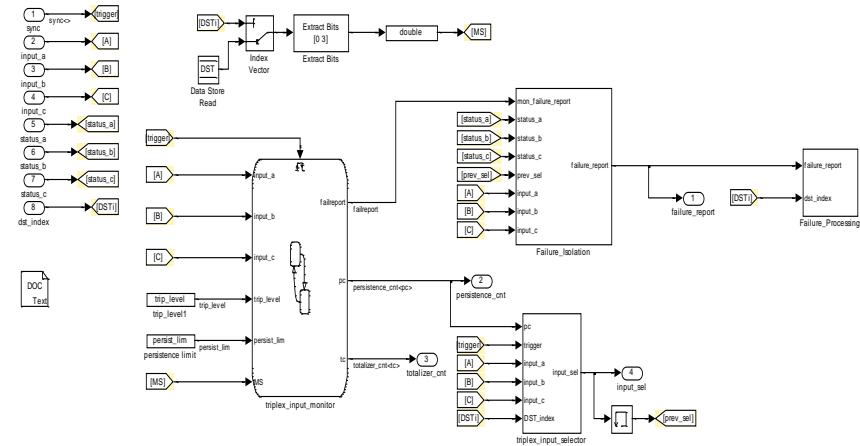

Counterexample Found in 5 Seconds

**Checked 573 Properties -
Found and Corrected 98 Errors
in Early Design Models**

CerTA FCS Phase I

- Sponsored by AFRL
 - Wright Patterson VA Directorate
- Compare FM & Testing
 - Testing team & FM team
- Lockheed Martin UAV
 - Adaptive Flight Control System
 - Redundancy Management Logic
 - Modeled in Simulink
 - Translated to NuSMV model checker

Phase I Results

| | Effort (% total) | Errors Found |
|----------------|---------------------|-----------------|
| Testing | 60% | 0 |
| Model-Checking | 40% | 12 |

MBD Formal Analysis Efforts

Examples of Using Formal Methods

Examples of Using Formal Methods

Examples of Formal Methods

High Speed Encryptor

Examples of Formal Methods

Examples of Using Formal Methods

CerTA FCS Phase II

Turnstile High Integrity Guard

- High-assurance cross domain platform that provides secure communication between different security classification domains ranging from top secret to unclassified.

Accreditable t

- Core guard application is based on the NSA certified AAMP7G.
- I/O processing is relegated to Offload Engines (OE) that do not have to be as highly trusted.
- System integrator can add function to the OE without compromising the guard function.
- Certification based on ACL2 theorem prover

Outline of Presentation

Introduction

Why use Model-Based Development?

Requirements

Design

Implementation: Code Generation

Verification and Validation

Pitfalls

Problem 1:

Using Models Where They Don't Fit

If MBD notation doesn't provide a better representation of your problem than code, you're wasting your time.

Remedies

- Perform honest assessment of where MBD notations can be used
 - They do not do everything
 - Recursive data structures are especially difficult to model.
 - Use models where they are a good representation.
- Create a partitioning strategy between models and code for applications that contain both complex mode logic and complex data.

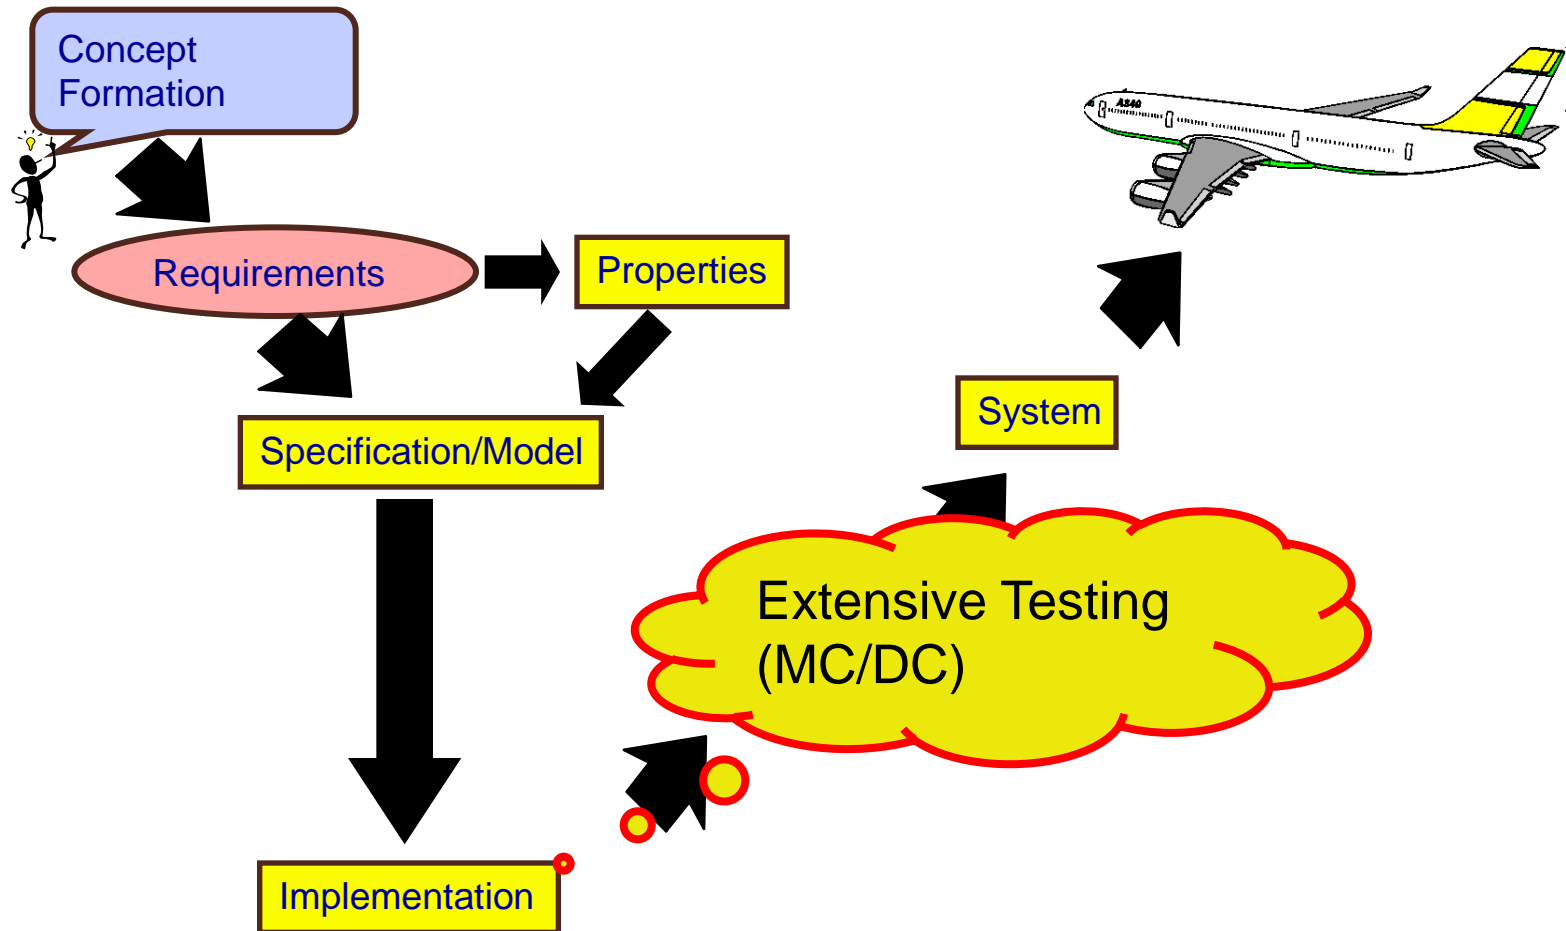

Problem 2

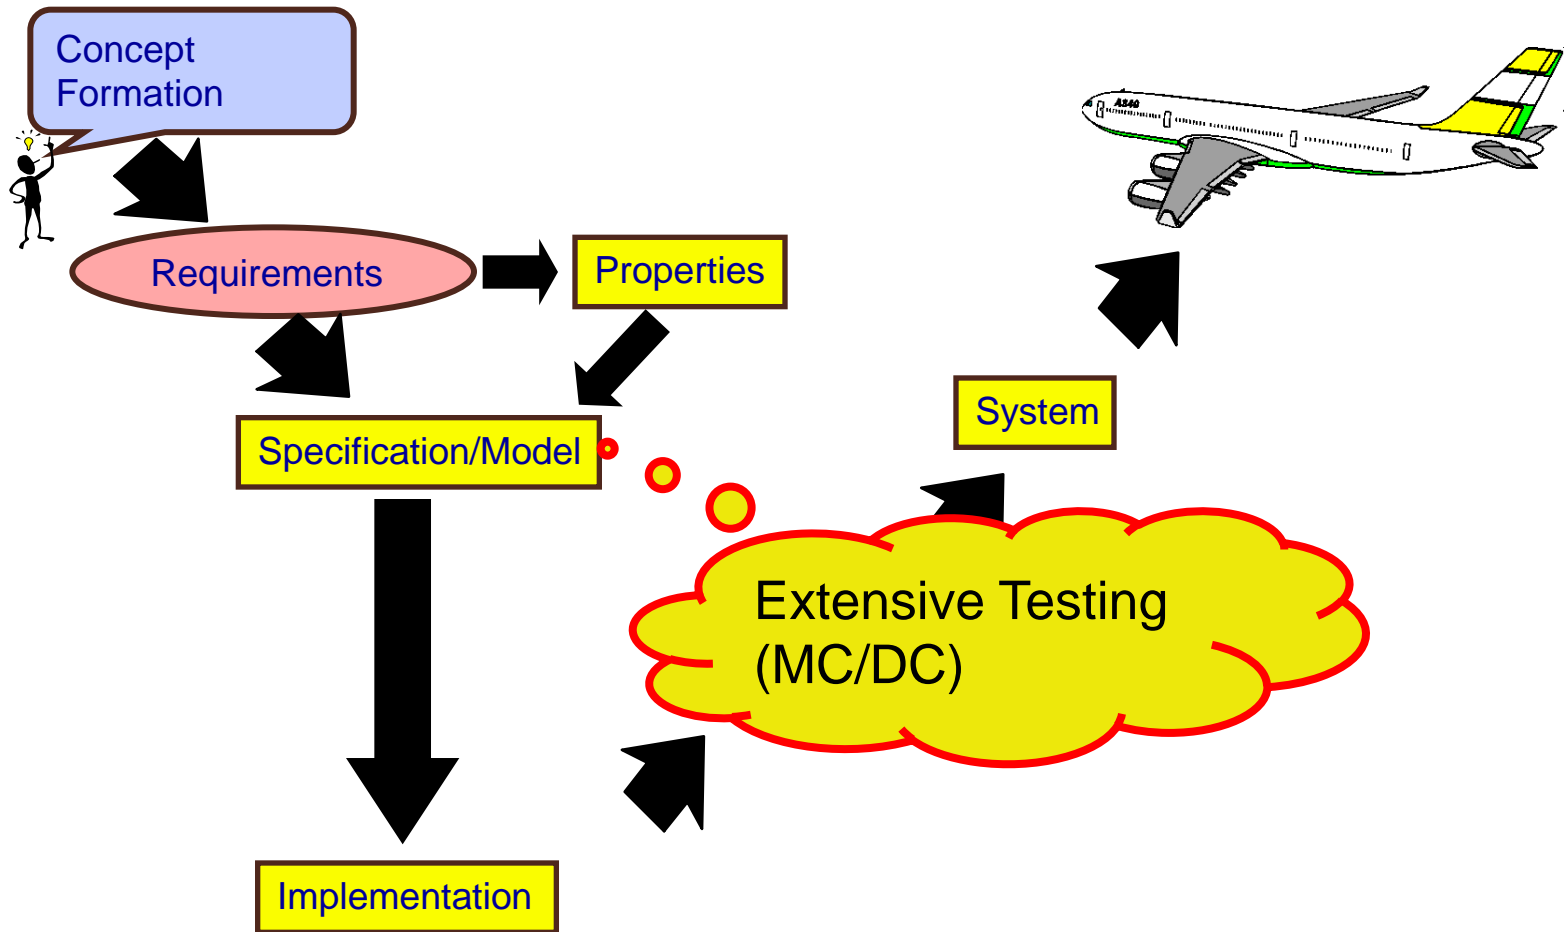

Believing Testing Can be Eliminated

**Testing will always be a crucial
(and costly) component**

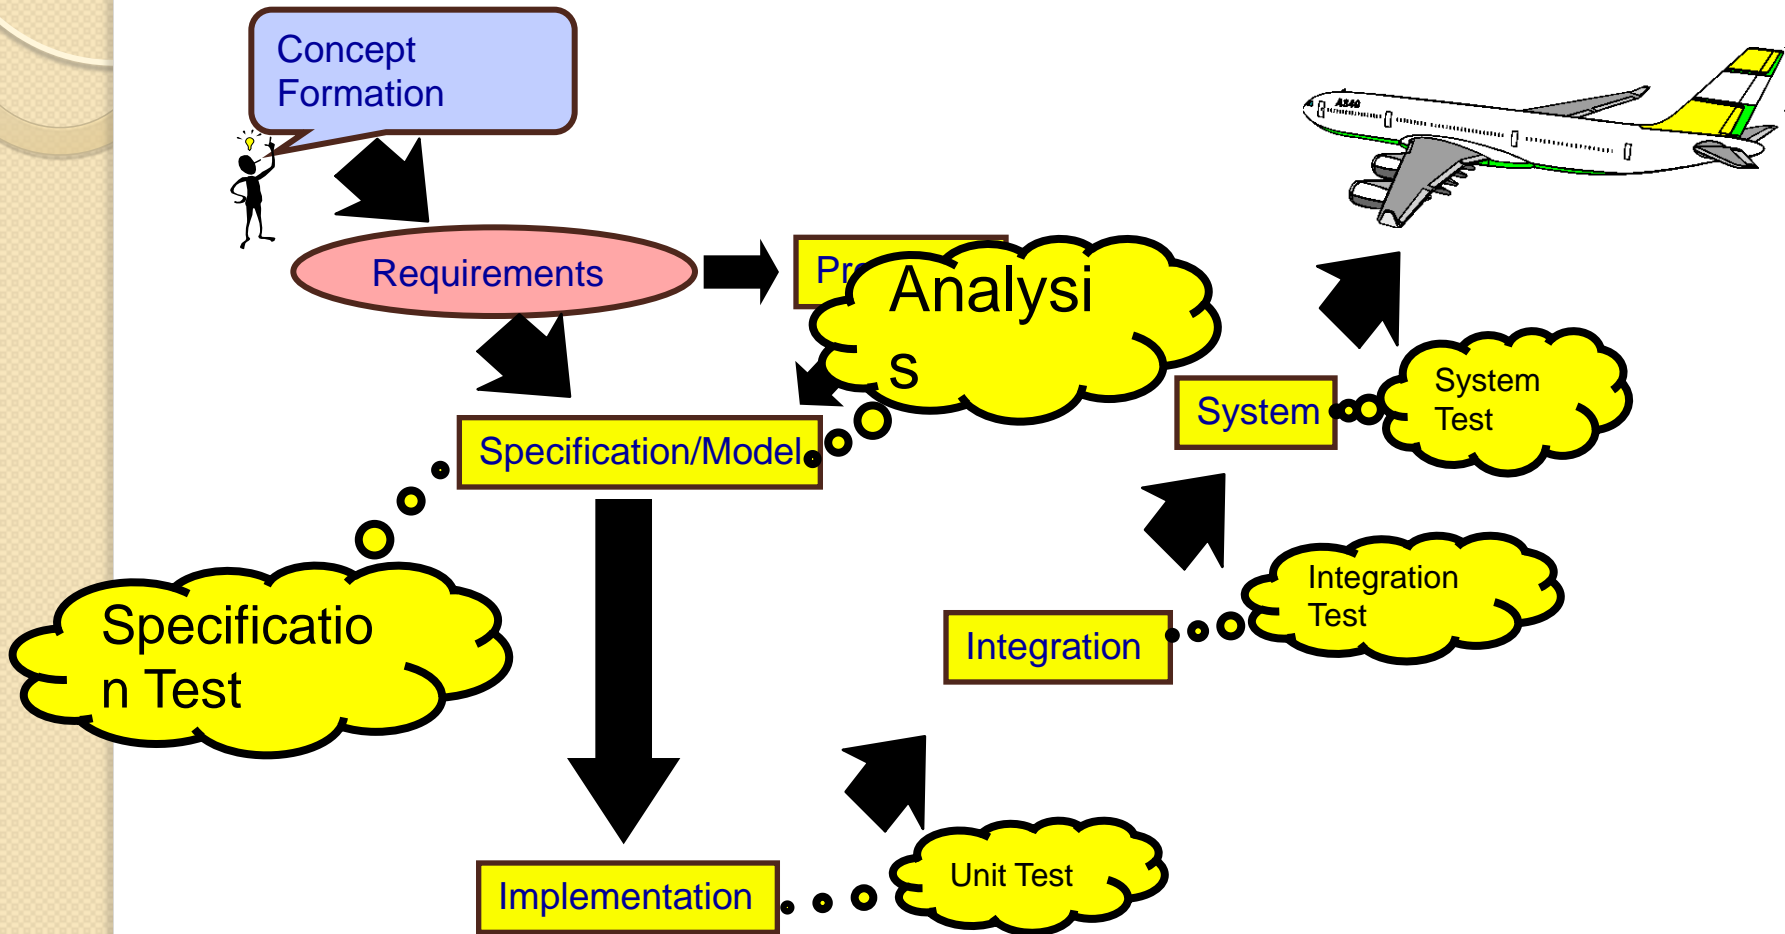

Testing Does not go Away

It Simply Moves

Do it the Right Way

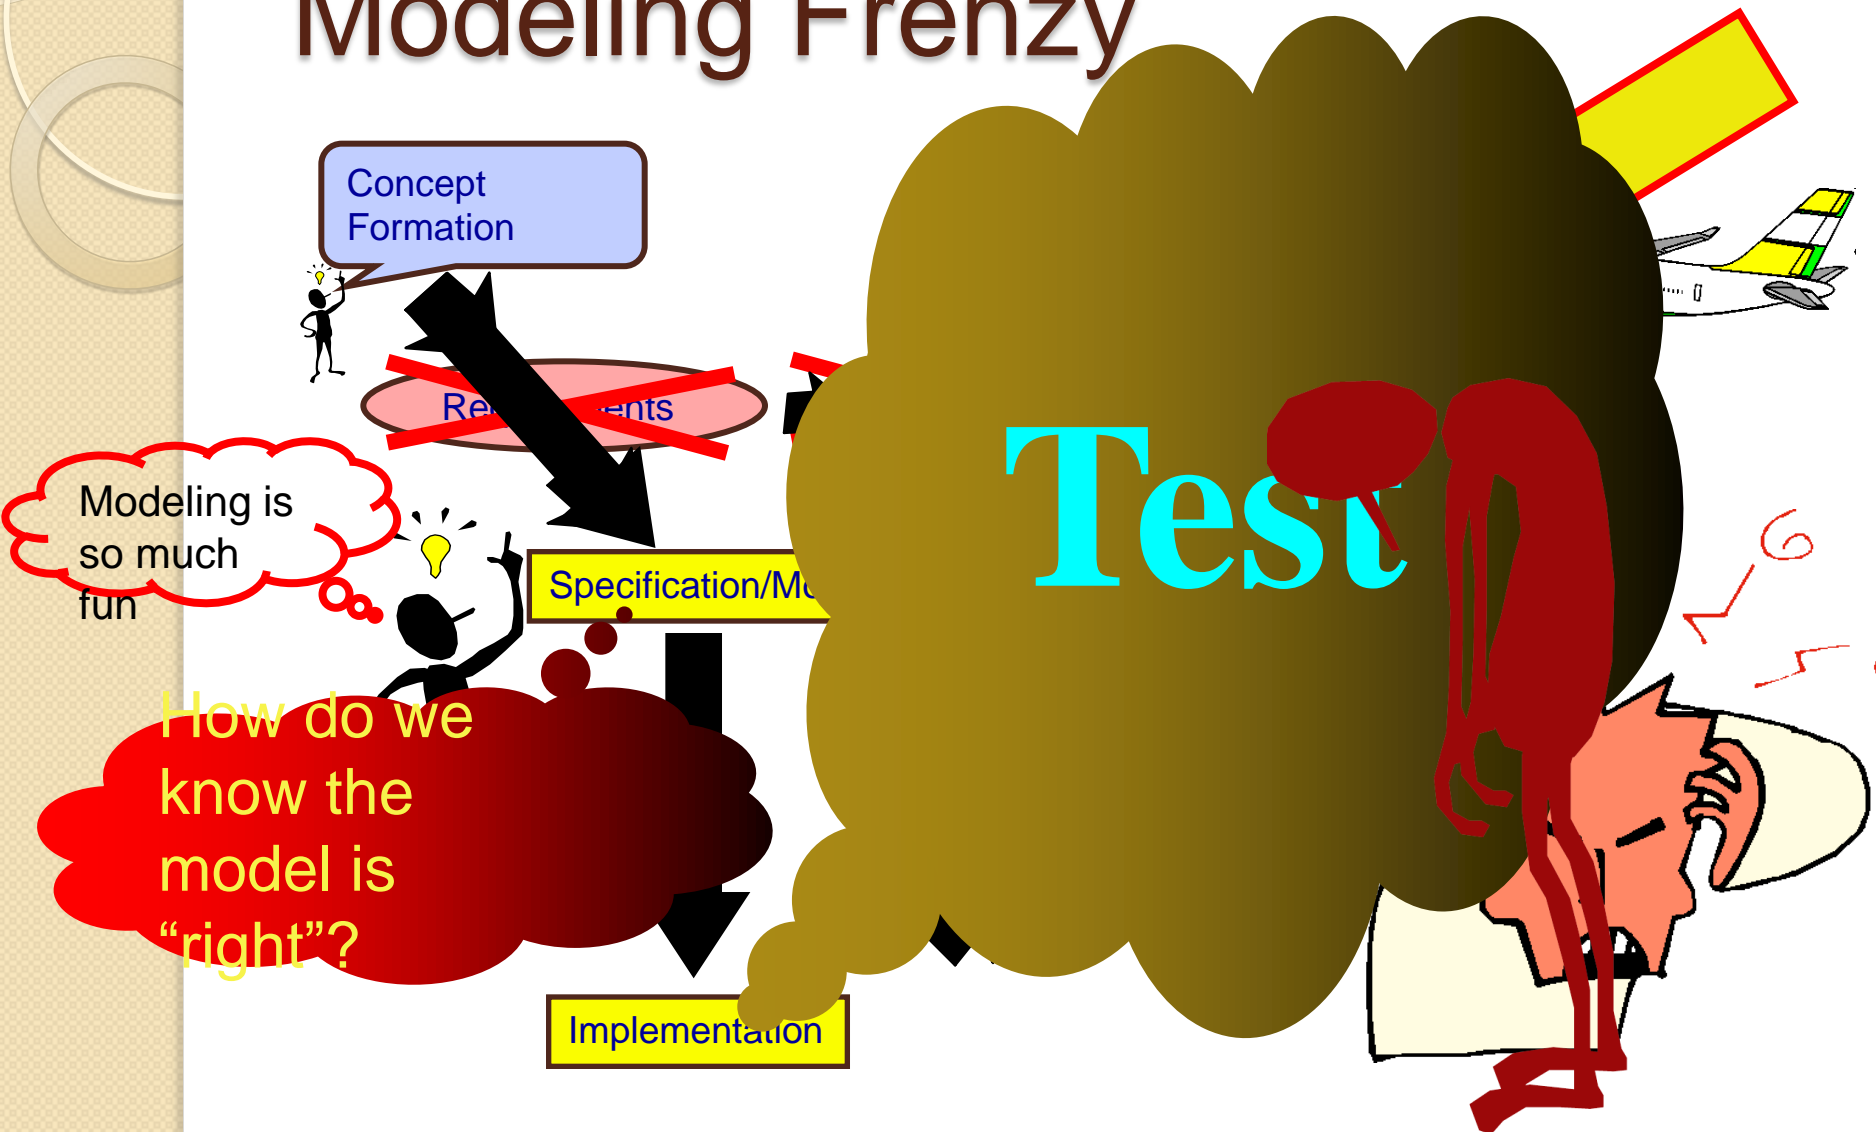

Problem 3

Believing the Model is Everything

The model is never enough

Modeling Frenzy

Remedies

- **Recognize the Role of Software Requirements**
 - The model is not everything
- **Development Methods for Model-Based Development Badly Needed**
 - Model-Based Software Development Process
- **Develop Tools and Techniques for Model, Properties, and Requirements Management**
- **Develop Inspection Checklists and Style Guidelines for Models**

Problem 4

Trusting Verification

**To really mess things up,
you need formal verification**

Property or Model: Who is Right?

~~The Mode Annunciations shall be turned on when the Flight Director is turned on~~

~~AG(Onside_FD_On -> Mode_Annunciations_On)~~

~~If this side is active, the Mode Annunciations shall be turned on when the Flight Director is turned on~~

~~AG((Is_This_Side_Active & Onside_FD_On) -> Mode_Annunciations_On)~~

If this side is active and the Mode Annunciations are off, the Mode Annunciations shall be turned on when the Flight Director is turned on

AG(! Mode_Annunciations_On ->
AX ((Is_This_Side_Active & Onside_FD_On)
-> Mode_Annunciations_On)))

Remedies

- Develop techniques to determine adequacy of model and property set
 - How do we know they are any “good”
- Techniques for management of invariants
 - How do we validate the assumptions we make
- Methodology and guidance badly needed
 - Tools with training wheels
 - “Verification for Dummies”

**All we need is one high-profile verified system
to fail spectacularly to set us back
a decade or more**

Conclusions

- MBD can significantly improve developer productivity, cost, schedule, and quality
- ...or it can make your life miserable
- The important thing is to ***know why you're doing it!***
 - Know the limitations of what can be modeled using the DSNs
 - Know which capabilities you hope to use
 - Design and quality of models depends on this
- V & V receives the largest benefit of the MBD approach
 - Mature tools for test-case generation
 - Starting to see model checking built into commercial tools: SCADe Verifier, Simulink Design Verifier
- There are many other things to discuss! Versioning, diff, semantics, tool costs, training, structuring, vendor

Medical Cyber-Physical Systems

Improving patient treatment by coordinated systems of medical devices

Research directions:

- Medical device interoperability
- High-confidence development
 - Model-driven design
 - V&V, regulatory approval
- Smart alarms and decision support
- Physiological closed-loop control

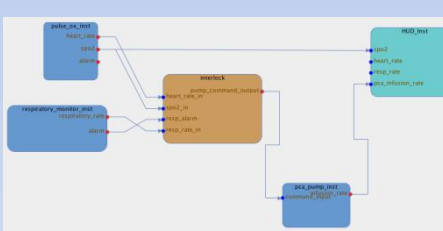

Supported by NSF CNS-1035715
<http://rtg.cis.upenn.edu/MDCPS/>

Participants

- University of Pennsylvania
- U. Penn Hospital System
- University of Minnesota
- CIMIT/MGH

Coordination framework for medical devices

- Build high-confidence middleware
 - Rely on formal methods and static analysis
- Design a language for executable clinical scenarios
 - Specify information flows
 - Identify timing constraints
 - Ensure non-interference

Model driven development and assurance cases

High-assurance development:

- Modeling, code synthesis
- Model-level verification, code-level validation

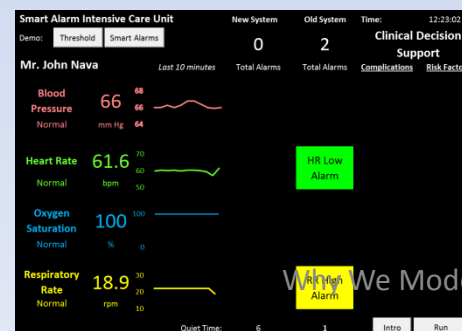

Assurance case construction reflects development process structure
 Applied to pacemaker, PCA pump

Smart alarm systems

- Reduction of irrelevant alarms for CABG patients
 - Based on aggregation of multiple vital signs and fuzzy logic
- On-going research:
 - Prediction of vasospasm in neuro-ICU patients

5/27/2013

Networked Blood Glucose Control System

Safety-critical, closed-loop MCPS

Research issues:

- Identifying new risks and hazards
- Mitigation strategies
- Validation
- Control design

Pursue model-driven approach
