About the survey

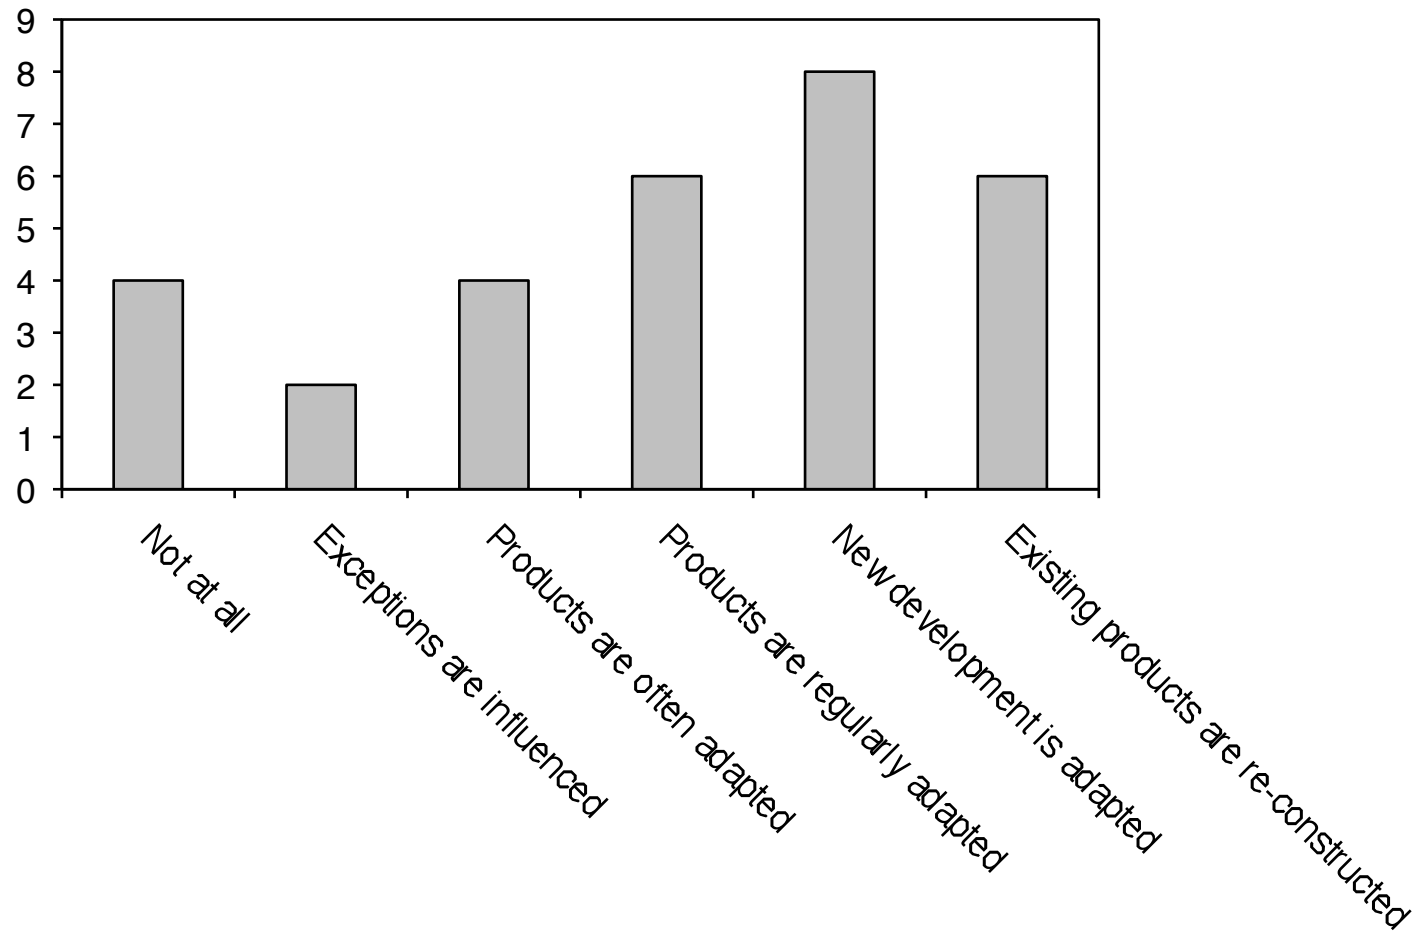

The survey was sent to regional companies that had registered interest in software development in public registers.

The survey solicited responses from 27 companies defined as SMEs and another 5 from companies that are classified as large.

It covered quite a bit of material, but here we focus on the modeling and the companies view on usefulness and applicability.

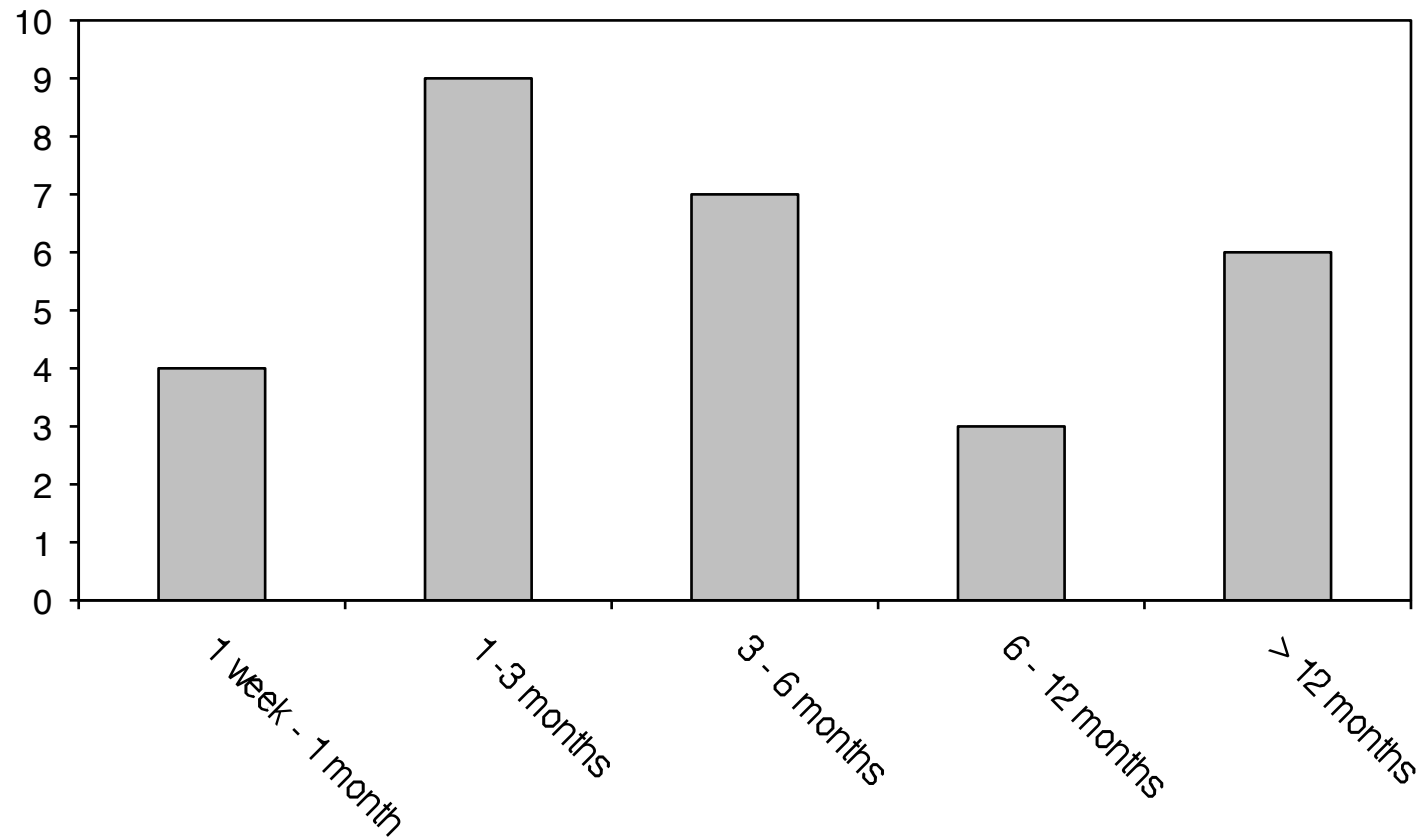

Sensitivity to new software technology

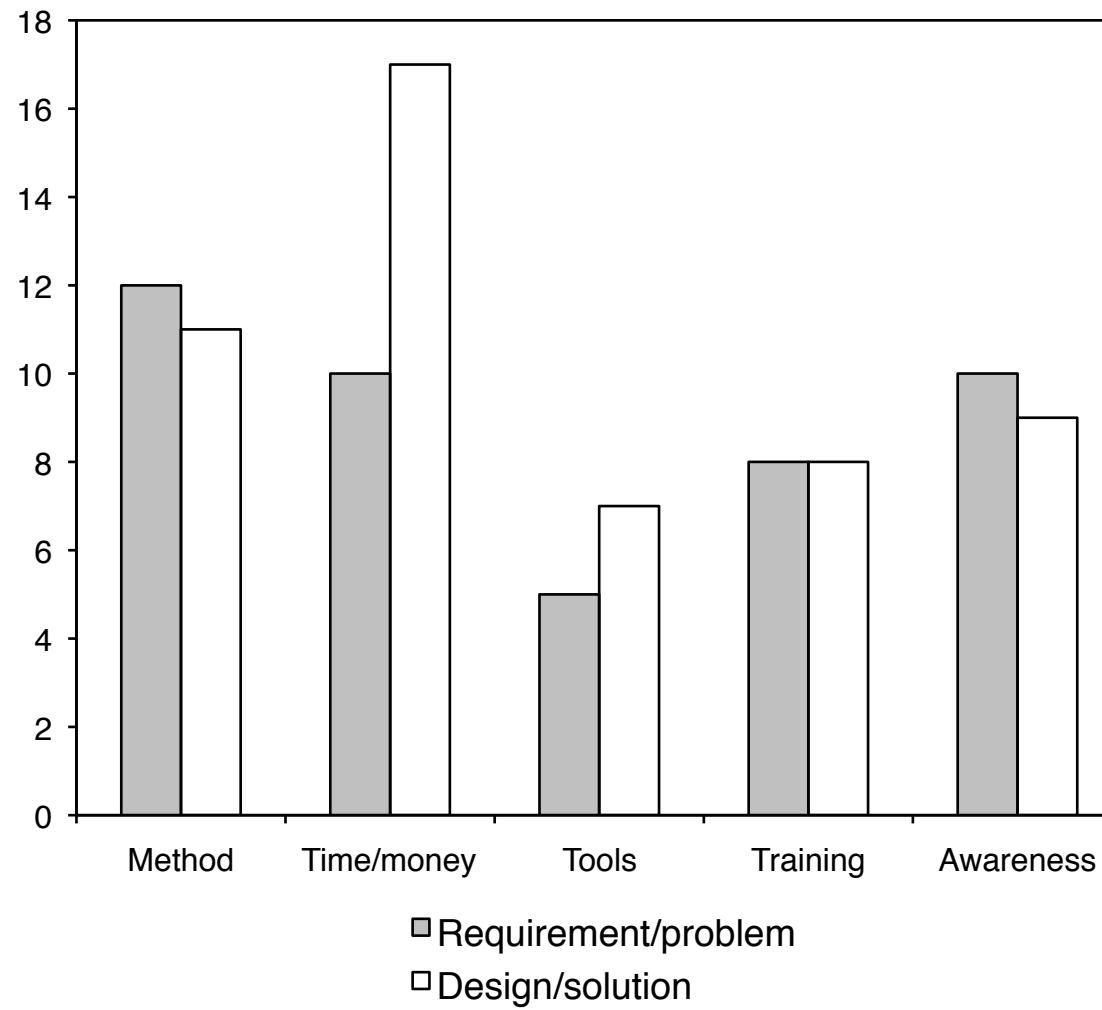

Runtime of typical development projects

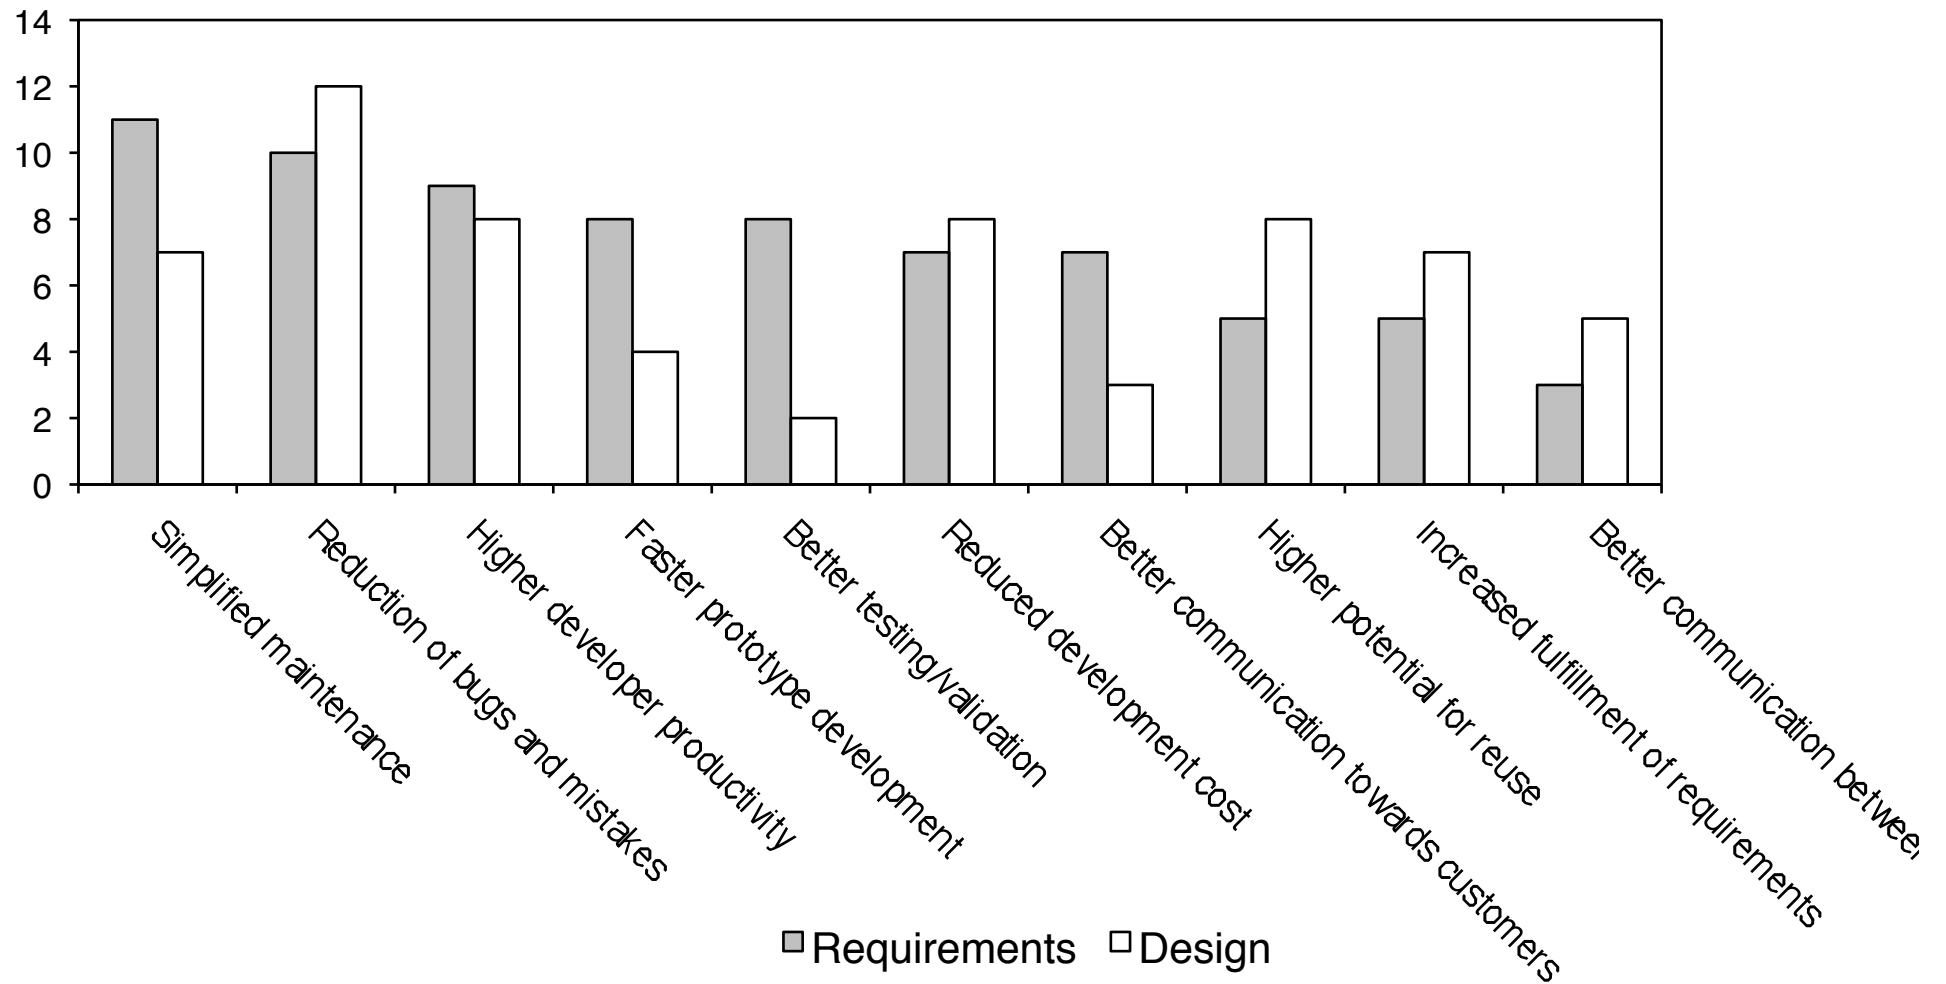

Needs

Percieved potential

In summary

Rapid changes means that models must adapt rapidly.

Small series of software and short projects means that there is **no** time for back-porting models.

Most developers are pragmatic and only use models that contribute to getting the software done. No one will do modeling for the sake of making the set of models "complete" or complementary.

For SMEs, training is an issue.
